

Diagnose and Improve an Agent's Behavior Using Logs and Examples

Agent Behavior

It's easy to build a demo agent that runs well in theory, but real-world use often exposes failure points. In this hands-on lab, you'll review log outputs and user-agent interaction transcripts to uncover where things went wrong, and how to fix them.

Instructions for learners

You'll analyze two pre-built agent runs. For each, identify

- One visible failure (e.g., tool misuse, looping, hallucination)
- The likely root cause (e.g., missing prompt constraint, poor fallback logic)

Then, rewrite the original agent flow or prompt that caused the failure, and briefly explain how your change will improve performance.

Conclusion

This is your chance to practice debugging AI systems, a critical skill for deploying agents into complex, dynamic environments.
